

Denon's One Cable Connection

All Denon AVR10 series AV receivers provide the ultimate in convenience by accepting all types of video signals from any source and converting them all to one convenient HDMI signal.

This allows you to connect a composite video, and S-Video and component video all to your Denon AVR and all these signals will be converted to a single HDMI output that has been adjusted from a Standard Definition (interlaced) signal to a High Definition compatible (Progressive) signal.

This means that with this great feature you will only need to select one AV input on your television and your Denon AV receiver will not only switch the sound going to your speakers but will also switch the picture going to your new flat screen television or projector.
