

## Audyssey MultEQ

One of the biggest obstacles to achieving a great Home Theatre experience is actually the rooms we are using for our Home Theatre.

Unlike the studio environment the director used to create the soundtrack, our living rooms are generally not acoustically designed and contain many items that can have many adverse effects on the end sound result. Items such as couches, floor coverings, curtains and adjoining rooms can all add distortions to the sound waves which can dramatically effect the surround sound result.

Audyssey MultEQ is a revolutionary process that uses a microphone (supplied with all Denon AV receivers) to measure the exact room acoustics pattern of your room and make individual equalization adjustments to each speaker so that the end result is a Home Theatre system that is acoustically matched to your living environment.

Audyssey MultEQ provides a much broader listening area so that all of the family can now enjoy the “sweet spot” effect of Home Theatre.

Audyssey MultEQ creates 3 different EQ patterns for your individual Home Theatre environment:

- **Audyssey:** which is perfect for the movie experience.
- **Flat:** specifically designed for your favourite music.
- **Bypass:** which leaves your main front speakers unaltered whilst making corrections to your centre and surround channels.
